

NOTICE OF AN APPLICATION FOR PLANNING PERMIT

The land affected by the application is located at:
161 Baddaginnie-Benalla Road, Benalla
Crown Allotment 33, Section U
Parish of Benalla

The application is for a permit to:
To use and develop the land for a dwelling

The applicant for the permit is:
Ms Leanne Maxwell
Regional Planning Services

The application reference number is:
P0049/24
DA7655

Any person who may be affected by the granting of the permit may object or make other submissions to the responsible authority.

An objection must:

- * be made to the responsible authority in writing;
- * include the reasons for the objection; and
- * state how the objector would be affected.

The responsible authority must make a copy of every objection available at its office for any person to inspect during office hours free of charge until the end of the period during which an application may be made for review of a decision on the application.

The Responsible Authority will not decide on the application before:
17 June 2024

If you object, the Responsible Authority will tell you its decision.

Clear Form

Office Use Only

Application No.: _____ Date Lodged: / /

Application for a **Planning Permit**

If you need help to complete this form, read **MORE INFORMATION** at the end of this form.

 Any material submitted with this application, including plans and personal information, will be made available for public viewing, including electronically, and copies may be made for interested parties for the purpose of enabling consideration and review as part of a planning process under the *Planning and Environment Act 1987*. If you have any questions, please contact Council's planning department.

 **Questions marked with an asterisk (*) must be completed.**

 **If the space provided on the form is insufficient, attach a separate sheet.**

 Click for further information.

The Land

Address of the land. Complete the Street Address and one of the Formal Land Descriptions.

Street Address *

| | | |
|------------------|----------|-----------|
| Unit No.: | St. No.: | St. Name: |
| Suburb/Locality: | | Postcode: |

Formal Land Description *

Complete either A or B.

 This information can be found on the certificate of title.

If this application relates to more than one address, attach a separate sheet setting out any additional property details.

A Lot No.: Lodged Plan Title Plan Plan of Subdivision No.:

OR

B Crown Allotment No.: Section No.:

Parish/Township Name:

The Proposal

 You must give full details of your proposal and attach the information required to assess the application. Insufficient or unclear information will delay your application.

 **For what use, development or other matter do you require a permit? ***

 Provide additional information about the proposal, including: plans and elevations; any information required by the planning scheme, requested by Council or outlined in a Council planning permit checklist; and if required, a description of the likely effect of the proposal.

 **Estimated cost of any development for which the permit is required ***

Cost \$  You may be required to verify this estimate. Insert '0' if no development is proposed.

Existing Conditions

Describe how the land is used and developed now *

For example, vacant, three dwellings, medical centre with two practitioners, licensed restaurant with 80 seats, grazing.

 Provide a plan of the existing conditions. Photos are also helpful.

Title Information

Encumbrances on title *

Does the proposal breach, in any way, an encumbrance on title such as a restrictive covenant, section 173 agreement or other obligation such as an easement or building envelope?

- Yes (If 'yes' contact Council for advice on how to proceed before continuing with this application.)
- No
- Not applicable (no such encumbrance applies).

 Provide a full, current copy of the title for each individual parcel of land forming the subject site. The title includes: the covering 'register search statement', the title diagram and the associated title documents, known as 'instruments', for example, restrictive covenants.

Applicant and Owner Details

Provide details of the applicant and the owner of the land.

Applicant *

The person who wants the permit.

Declaration

This form must be signed by the applicant *

 Remember it is against the law to provide false or misleading information, which could result in a heavy fine and cancellation of the permit.

I declare that I am the applicant; and that all the information in this application is true and correct; and the owner (if not myself) has been notified of the permit application.

Signature:

Date:

day / month / year

Privacy consent

I give consent to my personal information disclosed in the application to be made available for public inspection, including on Council's public website, whilst the application is being determined, in accordance with Section 51 of the Planning and Environment Act 1987.

Yes No

Signature:

Date:

day / month / year

Need help with the Application?

General information about the planning process is available at planning.vic.gov.au

Contact Council's planning department to discuss the specific requirements for this application and obtain a planning permit checklist. Insufficient or unclear information may delay your application.

Has there been a pre-application meeting with a council planning officer?

No Yes

If 'Yes', with whom?:

Date:

day / month / year

Checklist

Have you:

Filled in the form completely?

Paid or included the application fee?

 Most applications require a fee to be paid. Contact Council to determine the appropriate fee.

 Provided all necessary supporting information and documents?

A full, current copy of title information for each individual parcel of land forming the subject site.

A plan of existing conditions.

Plans showing the layout and details of the proposal.

Any information required by the planning scheme, requested by council or outlined in a council planning permit checklist.

If required, a description of the likely effect of the proposal (for example, traffic, noise, environmental impacts).

Completed the relevant council planning permit checklist?

Signed the declaration above?

Lodgement

Lodge the completed and signed form, the fee and all documents with:

Benalla Rural City Council
PO Box 227
Benalla VIC 3671

Customer Service Centre

GENERAL NOTES

- WATERPROOFING REQUIREMENTS: TO INCLUDE ENTIRE FLOOR OF ENSUITE 1 & 2 & BATHROOM AND UP TO 2200mm IN SHOWER ENCLOSURE WALLS, AND 150mm HIGH ELSEWHERE FOR SKIRTING TILES. PRODUCT TO BE MAPEI MAPEGUM WP FAST DRYING FLEXIBLE LIQUID MEMBRANE FOR WATERPROOFING (APPLY AT 3mm MIN. THICKNESS). PROVIDE MATCHING WATERPROOFING TAPE TO JOINTS BETWEEN FLOOR AND WALLS. BOTH PRODUCTS TO BE APPLIED IN STRICT ACCORDANCE WITH MANUFACTURERS SPECIFICATIONS.
- SET OUT FOR SHOWER RECESS IN TIMBER FLOOR TO ENSUITE 1 & 2 & BATHROOM TO FALL TO END GRATES AS NOTED ON PLANS.
- ALL CEILINGS TO HAVE CORNICE TO OWNER'S SELECTION, EXCEPT FOR GARAGE WHICH IS TO HAVE 55mm COVE CORNICE. ALL WET AREA WALLS (ENSUITE 1 & 2 AND BATHROOM) TO BE WATERPROOF PLASTERBOARD (9mm) VILLABOARD.
- HEATING SYSTEM TO BE SELECTED SOLID FUEL HEATER IN LIVING ROOM AND DUCTED REVERSE CYCLE AIR CONDITIONING.
- PAINTING: ALL PAINTING WORKS TO BE 3 COAT APPLICATION BASE / SEALER COAT WITH 2 TOP COATS. SEE SCHEDULE. UNLESS OTHERWISE NOTED ALL MATERIALS MUST BE PREMIUM GRADE PAINTS (WET TRADE PAINTS). ALL PREPARATION, TYPE OF PAINT AND NUMBER OF COATS OF EACH TYPE IS TO BE IN ACCORDANCE WITH THE MANUFACTURERS RECOMMENDATION. PREPARATION OF SURFACES & PAINTING SYSTEMS:- THIS SPECIFICATION IS TO BE TAKEN AS A MINIMUM STATEMENT OF REQUIREMENTS.
- TILING: WALL TILES SHALL BE TO THE FOLLOWING MINIMUM STANDARD:- GRIND OFF ANY LUMPS AND CERAMIC WALL TILES SHALL BE AS SELECTED BY OWNER. GROUT COLOUR AS SELECTED BY OWNER. PROVIDE MATCHING COLOUR SILICONE SEALANT.
- INTERNAL WALL FINISHES: GENERALLY LINE WITH PLASTERBOARD OR FIBRE CEMENT SHEET. PLASTERBOARD:- GYPSUM PLASTERBOARD TO AUSTRALIAN STANDARD AS 2588. RECESSED EDGES FOR FLUSH JOINING. (UNLESS NOTED OTHERWISE) FIBRE CEMENT SHEET:- 9mm THICK VILLABOARD (FIBRE CEMENT SHEET. RECESSED EDGED FOR FLUSH JOINING.

Introduction

An investigation has been undertaken to assess the overall capability of 125 Baddaginnie-Benalla Road Benalla for the purpose of on-site wastewater management and to investigate the merits of undertaking future un-sewered development on the land. This report provides information about:

- Soil conditions;
- Site constraints;
- General indicative advice about appropriate wastewater treatment system and land application methods in response to overall site and soil characteristics; and
- Indicative wastewater land application area sizing

The findings of this report have been made in context of prioritising public and environmental health with generic design recommendations framed on achieving sustainable wastewater disposal with acceptable residual environmental and public health risk.

Methodology

The field component of the land capability assessment was undertaken on 1 February 2024 employing the methodology of Victorian EPA publication No. 746.1 *Land Capability Assessment for Onsite Domestic Wastewater Management* and Publication 891.4 *Victorian Code of Practice – Onsite Wastewater Management 2016 (CoP)*. It was also undertaken in accordance with *Australian Standard AS/NZS 1547:2012 On-site Domestic Wastewater Management*. The indicative wastewater disposal system dimensions have been calculated using the *Code of Practice* and water balance modelling.

The study methodology has comprised the following:

- A desktop study of relevant geological, topographical, climate and soil references;
- Soil and site assessment;
This included the drilling, logging and sampling of two investigation bore holes across the subject land in order to establish soil profile conditions and identify spatial variations across the subject land. A 75mm hand auger was used to drill the bore holes;
- Soil permeability was derived using the Talsma-Hallam method and the visual / tactile method which included an assessment of sub-soil texture and structure;
- Water and nutrient balance analysis based on the 9th decile wet year rainfall derived from the mean monthly rainfall data for the Benalla Weather Station (Bureau of Meteorology Station No. 082170); and
- Analysis of findings and report writing.

Benalla Planning Scheme

Farming Zone (FZ)

The Schedule to Clause 35.07-2 (Farming Zone) of the *Benalla Planning Scheme* seeks *inter alia* to protect water quality and waterways as natural resources in accordance with the provisions of relevant State Environment Protection Policies, and particularly in accordance with Clauses 33 and 35 of the *State Environment Protection Policy (Waters of Victoria)*. A key purpose of this LCA is to demonstrate compliance with the requirements of the Farming Zone of the *Benalla Planning Scheme*.

Site Assessment

Table 1
Site Summary

| | Response |
|--|---|
| Site Address | 125 Baddaginnie-Benalla Road, Benalla |
| Zone | Farming Zone (FZ) |
| Catchment Status | Not a Declared Special Water Supply Catchment |
| Existing Development | The study area portion of the subject land is cleared with no development. |
| Climate Benalla Weather Station (Bureau of Meteorology Station No. 02002) | Rainfall – 644mm 9 th Decile – 773mm Evaporation – Approx 1400mm http://www.bom.gov.au/climate/averages/tables/cw_082002.shtml |
| Aspect | Flat with excellent solar exposure |
| Vegetation | Pasture grasses and no evidence of hydrophilic species at the study site |
| Landform | Linear-planar |
| Slope | ~2% |
| Fill | None evident - natural profiles observed |
| Rocks and Rock Outcrop | None observed |
| Surface Water | The nearest waterway is One-mile Creek located > 100m east of the study area. |
| Flood Potential | Less than 1:100 AEP (not located within FO) |
| Stormwater run-on and upslope seepage | Given the location of the study area and topography significant stormwater run-on is not expected. |
| Depth to Groundwater | Groundwater not encountered although (seasonally) saturated soils possible. According to DEECA Groundwater Resource website depth to water table is <5m: https://mapshare.vic.gov.au/Geocortex/Essentials/EXT/REST/TempFiles/groundwater_report_20240218_111624.pdf?guid=3f15ea05-9670-41e4-a5f3-cf24b73c60db&contentType=application%2Fpdf |
| Site Drainage and Subsurface Drainage | The presence of (red) mottling within the observed profiles is indicative of a soil moisture regime that has fluctuation. The overall reddish colour of the subsoil is typically indicative of good drainage. |

Soil Assessment Overview

Two assessment boreholes were drilled within the study area (**Appendix B**). This was sufficient to adequately characterise the soils of the immediate landscape and subject land for the purpose of the dwelling proposal. Excavation logs are provided at **Appendix C**. The soils are characterised by:

| Table 2: Soil Profile Summary | | | | |
|--|--------------------------|---------------|---------------|-----------|
| Horizon | Lower Horizon Depth (mm) | Colour | Field Texture | Structure |
| A1 | 0- ~100 | Dark Brown | Loam | Moderate |
| A2 | ~100 - ~200 | Brown | Clay Loam | Moderate |
| B1 | ~200-500 | Brownish-red | Light Clay | Strong |
| B2* | ~500 - 1000 | Reddish-Brown | Medium Clay | Strong |
| Reddish colour of subsoil indicates that the subsoil is well drained Limited mottles indicate some soil moisture fluctuations Subsoil was strongly pedal *B2 Horizon has been adopted as the design horizon | | | | |

Nutrients

Clay-rich soils such as those found on this site can fix large amounts of phosphorous. Phosphate-rich effluent seeping through these soils will lose most of the phosphorous within a few metres. The limiting nutrient for this site is nitrogen and no phosphorous balance is required.

Nitrogen, that is contained in organic compounds forms nitrate-N when processed in an aerated treatment plant. Alternate periods of wetting and drying, with the presence of organic matter promotes reduction to nitrogen gas (denitrification). Plant roots absorb nitrates at varying rates depending on the plant species however a feature of nitrate is that it is mobile and can be readily leached. Accordingly, it can enter groundwater via deep seepage and surface waters via overland flow and near-surface lateral flow. Indicative site land application sizing has been made with reference to a nitrogen balances shown at **Appendix D** and

Table 8.

Subsoil Sodicity, Emerson Class, Salinity and pH

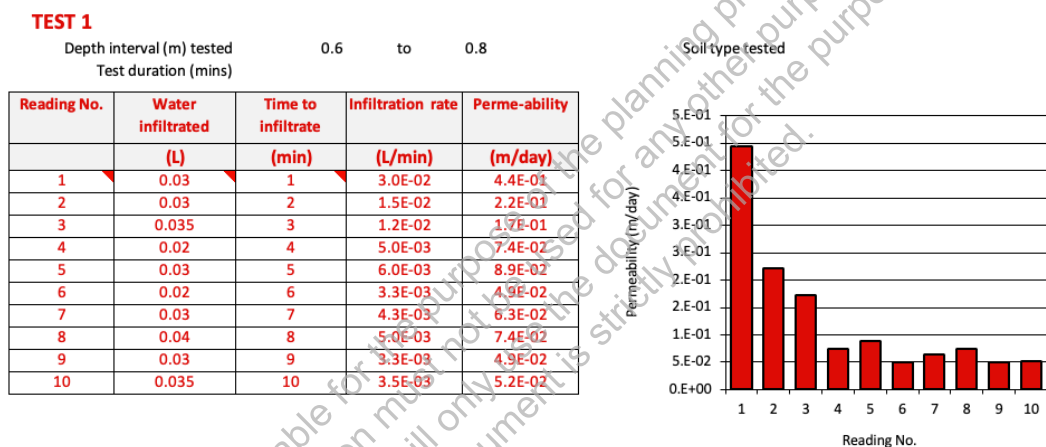

Soil particle flocculation is important because water moves mostly in large pores between soil aggregates. Soils with a high Exchangeable Sodium Percentage (ESP) will have reduced permeability (Ksat). Aggregate stability is also impacted by the amount of soluble salts (EC) in the soils. The high exchangeable sodium cation (ESP) rating and Emerson class 1 suggest that the subsoil could be susceptible to dispersion and that soil management should include measures to reduce soil dispersion. A summary of design horizon ESP, Emerson Class, Salinity and pH is provided at **Table 3** and **Appendix E**.

| Table 3: Sodicity Emerson Class Salinity and pH* | |
|---|-------------|
| Design Horizon | B2 |
| Emerson Class | 1 |
| Electrical Conductivity (1:5 Water) d/Sm | 0.04 |
| pH (1:5 Water) | 6.8 |
| Sodium % of cations | 8 |
| * Determined by Nutrient Advantage Laboratory | |

Permeability and AS/NZ1547:2012 Soil Category

Saturated hydraulic conductivity was measured using a constant head permeameter. The visual / tactile method which included an assessment of sub-soil texture and structure was also employed. A summary of results is provided in **Table 4**. Pursuant to EPA publication 891.4 (CoP) the indicative permeability of soils in the study area was ~ 0.05 m/day (Category 6a soil).

Table 4: Hydraulic Conductivity

Site Risk Analysis Land Capability Assessment

A range of site features have been assessed in terms of the degree of limitation they present for a range of onsite wastewater management systems (**Table 5**). Reference is made to the rating scale described in Table 1 of EPA Publication 746. *Land Capability Assessment for On-site Domestic Wastewater Management*.

| LAND FEATURES | TABLE 5 - LAND CAPABILITY CLASS RATING | | | | |
|--|--|--|--|--|--|
| | Low | Medium | High | Limiting / unsuitable | Ameliorative Measures & Risk Reduction |
| Available land for Land Application Area (LAA) | Lot size exceeds LAA and duplicate LAA requirements | Meets LAA and duplicate LAA requirements | Meets LAA and partial duplicate LAA requirements | Insufficient LAA area | |
| Aspect | North, north-east or north-west | East, west, or south-west | South or south-east | South – full shade | |
| Exposure | Full sun and / or high wind or minimal shading | Partial shade | Limited light, little wind, heavily shaded area | Perpetual shade | |
| Slope Form | Convex or divergent side slopes | Straight sided slopes | Concave or convergent side slopes | Locally depressed | |
| Slope Gradient Trenches & beds | < 5% | 5 – 10% | 10 – 15% | > 15% | |
| Slope Gradient Subsurface Irrigation | < 10% | 10 – 30% | 30 – 40% | > 40% | |

Edis Algorithm Risk Assessment

Initially developed for the *Mansfield Domestic Wastewater Management Plan*, the *Edis Algorithm* has become a widely used on-site wastewater management risk assessment tool and recognised as an accurate measure of risk. Using the *Edis Algorithm*, the risk rating for the subject land is **2.6 (low)**.

| Table 6 Edis Algorithm Risk Assessment | | | | |
|---|----------------------|-------------------------|-----------------------|-------------|
| Feature | Low (Rating of 1) | Medium (Rating of 2) | High (Rating of 3) | Risk Rating |
| R res Distance to reservoir | >15km | 2-15km | <2km | 1 |
| R Soil Soil Type Rating | 1 | 2 | 3 | 3 |
| R riv Distance to River | >80m | 40-80m | <40m | 1 |
| R str Distance to stream | >80m | 40-80m | <40m | 1 |

Wastewater Management

This Land Capability Assessment has been prepared to provide general advice as to the most appropriate treatment and land application systems at the proposed lot given the intrinsic site and soil characteristics of the study site. The following sections provide an overview of suitable systems at the subject land with general advice about sizing and design considerations, and their justification for selection.

Buffer Distances and Land Application Area Siting

As a general rule, future land application areas shall be sited so that:

- Where practical, they are exposed to prevailing winds and not shaded from sunlight, or are placed where nearby plants can help evapotranspiration of the effluent;
- They do not affect, or are not affected by and comply with requirements for setback distances from buildings, property boundaries, retaining walls and embankments; and
- Sufficient setbacks from surface water buffer distances are provided to prevent human contact, maintain public amenity and protect sensitive environments.

These principles will be required to inform land application area siting as will the prescribed setbacks within Publication 891.4 *Victorian Code of Practice – Onsite Wastewater Management* July 2016.

The nominated land application area shown at **Appendix B** provides *CoP* compliant surface water setbacks.

Theoretical Wastewater Flow and Organic Material Loading Rate Calculations

To calculate a theoretical land application area size appropriate for the site and for the purpose of determining a minimum lot size risk threshold and ultimately lot yield for the site, the assumptions of **Section 3.4.1** and **Table 4 of the Code of Practice** have been adopted.

Calculations have been based on one scenario – a four-bedroom dwelling (maximum occupancy). Redundancy is built into the calculations by assuming on-going occupation by maximum numbers of residents, 9th decile wet year rainfall and using standard water fixtures in water balance calculations.

| Table 7 Indicative Design Daily Wastewater Flowrate and Organic Material Loading Rate Calculations | | |
|--|--|-----------------------|
| | Calculation Input | Notes |
| No. Bedrooms | 4 | |
| Calculated occupancy | 5 | As per CoP |
| Design hydraulic flow rates (L/person/day) | 180 (standard water fixtures) 150 (water saving fixtures) | As per CoP |
| Daily wastewater flow rate* | 900 (standard water fixtures) 750 (standard water fixtures) | Calculated as per CoP |
| Organic material loading design rates (g BOD / Person / day) | 60 | As per CoP |
| Total Organic Material Loading Design Rate (g BOD / day) | 300 | Calculated as per CoP |
| *Design hydraulic flow rate and organic material design rate calculated in accordance with EPA publication 891.4 | | |

Septic Tank Capacity

Pursuant to Table J1 of AS/NZS 1547:2012, the minimum operational capacity for an all-waste septic tank in this instance is recommended to be:

- 3500L (4 Bedroom / Design Flow 1000-1400 l/day)

This capacity provides for sludge storage capacity providing for a maximum interval prior to desludging / pump out of 5 years (based on scum and sludge accumulation rates in AS/NZS 1547:2012).

Treatment and Land Application Options

Appendix K of AS/NZS 1547:2012 provides guidance on system selection. It summarizes common site and soil constraints and provides advice on land application systems that are best suited to the prevailing conditions. As a general rule, the more severe and numerous the constraints the fewer options, the riskier the system and greater maintenance and installation costs.

AS/NZS 1547:2012 requires, inter alia, the selection of the land application system to take into account:

- (a) The volume of wastewater produced;
- (b) The quality of the effluent discharging from the wastewater treatment unit;
- (c) The nature of the soil profile and resulting soil category;
- (d) The DLR/DIR associated with the soil category, (based on best available knowledge of the LTAR);

- (e) The required spacing between trenches/beds/irrigation lines or sprays;
- (f) Surface water and groundwater levels and movements; and
- (g) Local climate.

The chief constraint at the study site is relatively low-permeability Category 6a subsoils and potentially dispersive subsoils. Table K2 of *AS/NZS 1547:2012* makes the following recommendations to address and mitigate these constraints:

- Employ a larger application area;
- Reduce wastewater flow using water-saving devices;
- Dose effluent so wet the soil more than once a day;
- Place soil of good permeability within land application area;
- Install when soils are dry or only slightly moist;
- Avoid heavy equipment on application area when soils are moist or wet;
- Avoid smearing sides and bottoms of trenches and beds;
- Minimise domestic water use;
- Minimise discharge of sodium salts to application area;
- Alternate between different parts of the land application area.
- Apply Gypsum to receiving soil (min 1kg/m²) to all disturbed soil surface areas;
- Avoid construction during wet weather;
- Fill and close any trenches as required and cover with good topsoil as soon as possible;
- Construct interceptor bunds and drains to divert surface run-on and subsurface seepage around the land application area;
- Use water loving plants within the land application area;
- Import soil to raise ground level; and
- Avoid soaps and detergents with high sodium content.

Primary or secondary treatment would be suitable treatment options at the site however given the low K_{sat}, dispersive subsoils and shallow water table consideration should be given to secondary treatment of wastewater via an Aerated Wastewater Treatment System (AWTS). On-site wastewater disposal systems designed, constructed, operated and maintained in accordance with the recommendations of *AS/NZS 1547:2012* with appropriate regard to the site constraints is unlikely to impact on the beneficial use of surface waters and groundwater in the area.

Land Application Area Sizing Calculations

Primary or Secondary Treatment - Subsurface Irrigation

Within the proposed lot subsurface irrigation would be an appropriate land application method, particularly given the Category 6a subsoils. The preferred approach to calculate subsurface irrigation area land application area sizing is to undertake a water and nutrient balance calculation using *AS/NZS 1547:2012*. This method takes into account rainfall, evaporation and soil porosity to calculate the appropriate land application area.

The water balance seeks to find the minimum disposal area for a given wastewater discharge rate in this instance. The CoP indicates that the appropriate Design Irrigation Rate (DIR) as being 3mm / day in the Category 5b subsoils. Water and nutrient balance also assumes 30mg/litre N in the effluent, a denitrification rate of 20%, with N uptake of 220 kg/ha/year for a pasture comprising a rye/clover mix and sequential zoned dosing of the irrigation area, providing a conservative estimate of the nitrogen content in the deep seepage and lateral flow.

Without taking into account further expected denitrification below the root zone and in the groundwater (reported to be in the vicinity of 80%), denitrification in the lateral flow (external to the irrigation areas but within the curtilage of the allotment) and plant uptake in the lateral flow, the area required for Nitrogen uptake is shown in **Table 8** and **Appendix D** using **9th decile wet year rainfall** from

the nearby Benalla weather station **within the Category 6a subsoils**. A land application area of this size should provide a sustainable land application area with no surface discharge in the 9th decile wet year and adequate on-site attenuation of nutrients.

| Table 8: Area for Nitrogen Uptake [^] | 4 Bedroom Dwelling | |
|--|--------------------|-----------------------|
| | Standard Fixtures | Water Saving Fixtures |
| Land Application Area | 620m ² | 510 m ² |
| Area for Nitrogen Uptake | 358 m ² | 299 m ² |
| [^] Using water balance using Code of Practice hydraulic load, 9 th decile wet year, Category 6a soils | | |

Conclusion and Recommendations

The results of this study have concluded the following:

- The subject land is sufficiently clear of environmental constraints to assume successful on-site domestic wastewater management. Surface and ground waters should not be impacted if *CoP* setbacks and are applied and *AS/NZS 1547:2012* design recommendations adopted. The statutory setbacks have considerable in-built redundancy. ***CoP ground and surface water setbacks can be achieved utilising secondary wastewater treatment.***
- The lot size is substantially larger than the indicative land application area sizing calculated by this study, thereby supporting the notion that all wastewater should be able to be treated and retained within the bounds of the lot. ***Using 9th decile wet year rainfall, the calculations of this report suggest an indicative subsurface irrigation land application area of 620 m² (standard water fixtures) is likely to be appropriate for a future 4-bedroom dwelling within the Category 6a subsoils observed at the site.***
- *AS/NZS 1547:2012* provides system selection and design modifications that cater for specific site constraints and serve to reduce risk to an acceptable level in such situations. Many inherent site limitations may be overcome by applying *AS/NZS 1547:2012* system selection and design advice through the site-specific land capability assessment process. ***The relatively low permeability subsoils can be addressed via system design and management in accordance with AS/NZS 1547:2012; and***
- The development can occur in a manner that is ***consistent with the requirements and decision guidelines of the Benalla Planning Scheme.***

Key Site Constraints and Recommended Design Response

As identified and discussed in this report, the chief constraints at the subject land is:

- Low permeability Category 6a subsoils.

Pursuant to Table K2 of AS/NZS 1547/2012 the following are recommended to address mitigate this constraint:

- Reduce wastewater flow using water-saving devices;
- Irrigation systems designed using water balance (**Appendix D**);
- Dose effluent so as to wet the soil more than once a day;
- Placement of soil of good permeability around LAA;
- Install when soils are dry or slightly moist;
- Avoid heavy equipment on application area when soils are moist or wet;
- Avoid smearing sides and bottoms of trenches and beds;
- Minimise domestic water use;
- Minimise discharge of sodium salts to application area; and
- Alternate application between different parts of the land application area.

- Potentially dispersive (High ESP) soils.

High exchangeable sodium cation (ESP) rating suggest that the subsoil is susceptible to dispersion and that soil management should include measures to reduce soil dispersion. Pursuant to Table K2 of AS/NZS 1547/2012 the following are recommended to address mitigate this constraint:

- Avoid smearing bottoms of trenches and beds;
- Fill and close trenches as required and cover with good topsoil as soon as possible;
- Avoids soaps and detergents with high sodium content;
- Minimise discharges containing sodium salts;
- Apply Gypsum to receiving soil (min 1kg/m²) to all disturbed soil surface areas; and
- Avoid construction during wet weather.

- Shallow Water Table

Pursuant to Table K2 of AS/NZS 1547/2012 the following are recommended to address mitigate this constraint:

- Employ a larger land application area;
- Reduce Design Loading Rate;
- Import soil to raise ground surface level;
- Select dry or slightly moist conditions for installation;
- Minimise water use; and
- Minimise pedestrian traffic on land application area.

Primary and Secondary Treatment

Primary or secondary treatment would be suitable treatment options at the site however given the low K_{sat}, dispersive subsoils and shallow water table consideration should be given to secondary treatment of wastewater via an Aerated Wastewater Treatment System (AWTS). On-site wastewater disposal systems designed, constructed, operated and maintained in accordance with the recommendations of AS/NZS 1547:2012 with appropriate regard to the site constraints is unlikely to impact on the beneficial use of surface waters and groundwater in the area.

System Management Recommendations

Reserve Areas

Although reserve areas are not required for subsurface irrigation by the CoP they are nevertheless recommended as they provide an additional safety measure. A reserve area of 100% of the design area should be considered as part of the risk management process to be available at the site for expansion, for resting of the land application system, or for duplication of the land application system if other circumstances require this at some future time. The reserve area needs to be protected from any development that would prevent it being used in the future.

Soil Renovation

To improve soil structure and improve the stability of peds after receiving saline wastewater, gypsum application is recommended. Gypsum may be broadcast over the land application area at a rate of 1kg/m² and can be rebroadcast over the land application area at the same rate at a recurrence interval of 5 years.

Load Balancing

A load balancing mechanism enables short-term storage and sustainable flows to the distribution area over extended time. Surge flows are possible due to special events or gatherings and such situations can cause the system may become overwhelmed for a period. This potential problem can be eliminated by installing a plant with a load balancing facility (or equivalent function) which enables short-term storage and sustainable flows to the distribution area over extended time. Another benefit of the load balancing facility is that it can also provide temporary storage should the plant fail or if there is a power outage.

As Constructed Plans

Upon completion of system installation, 'as constructed' plans should be provided to Council and kept on file.

Zone Dosing

Future land application areas should be irrigated sequentially by zones to promote the creation of alternating and transient aerobic and anaerobic soil conditions. The nominated indicative site land application area is sized conservatively for nitrogen attenuation, using pasture grass (rye/clover mix), which has a nitrogen uptake of 220 kg/ha/year. A benefit of zoned dosing is that it will increase the efficiency of the land application area for removing nitrogen from the soil.

The principle risk of undersized land application area is that they are at risk of becoming anaerobic for long periods, with the risk of microbial build-up. Microbial build-up leads to secretion of microbial polysaccharides, which cover soil particles and restrict the ability of the soil to absorb nutrients and ultimately attenuate pathogens. Over time polysaccharides can coat the interior of pipes and block drainage holes if drainage is slow due to an overloaded land application area. This in turn can lead to effluent surcharge from the ends of the drainage pipes, forming preferential flow paths through overlying soil and draining to nearby surface waters. Alternating aerobic and anaerobic conditions created by zoned dosing assists in the prevention of the build-up of microbial polysaccharides, enhancing effluent renovation.

Pressure Compensated Subsurface Disposal

Pressure compensated subsurface disposal is recommended by this study. This system delivers effluent directly into the soil and for a surface flow containing effluent to occur, the effluent has to rise against gravity, through at least 150mm of soil. To ensure proper functioning there is a requirement for the pressure compensated distribution network to be placed parallel to contours and/or horizontal for even effluent distribution.

Stormwater Control

Waste water systems should be protected from rainfall run-off using methods such as the installation and use of bunds, cut-off drains, or improved surface drainage to prevent systems from hydraulic overloading. In addition, the land application system shall be shaped to shed rainfall.

Water Reducing Fixtures

It is recommended that future residences within the subject land be fitted with full water-reduction fixtures including the combined use of reduced flush toilets, shower-flow restrictors, aerator faucets, front-load washing machines and flow/pressure control valves on all water-use outlets.

Land use activity

Activities within the land application areas such as recreation activities, or grazing animals shall be controlled or prohibited so that soil compaction or interference with the function of the land application system is minimised and people avoid potential contact with effluent residues.

Unless allowed for in the design, future land application areas shall not:

- Be paved or sealed;
- Be subject to vehicular traffic (other than a pedestrian-controlled lawnmower);
- Be subject to regular foot traffic such as pathways;
- Have structures or buildings erected on it.

With regard to the land application system the following are also recommended:

- Regularly mowing of vegetation within the land application area;
- Heavy equipment should be avoided on LAA when soils are moist or wet;
- The operation and maintenance of the treatment and disposal system in accordance with manufacturer's recommendations.

Disclaimer:

Due regard has been made to undertake all aspects of this study in accordance with the requirements of best practice and relevant standards. LAA calculations have been made with due regard to AS/NZS1547:2012 and whilst the findings represent a reasonable interpretation of site conditions. It does not indicate that these findings represent the actual state of the site at all points. The complex interactions between the soil, climate, topography and wastewater mean that there is no one correct answer and the nominated results should be viewed in this context. The paucity of specific evaporation data is a limiting factor with regard to LAA calculations.

Land Management Plan

Thoroughbred Retraining Facility

Name : Rochelle Fay Adams

Phone : 0431 524 164

Property Address : CA 33 – 125 Baddaginnee-Benalla Road, Benalla 3672

Farm Size : 4.4ha

Farm Type : Equine

1) Aim of the Farm Business;

The aim of the business is to establish a property to facilitate the retraining of retired racehorses, to assist in rehoming them into the equestrian industry as performance horses.

The aim would be to have approximately 4 horses in training at any one time.

- 2) Summary of Land Management Issues - Erosion, salinity, pest plants and animals, wet areas, soil types, remnant vegetation, water courses;

The site has been very well maintained by the previous owner who has used the land for grazing cattle. The land is native grasses that has been supplemented with a clover/rye mix. There is little to no erosion or salinity issues due to a large number of mature eucalypts trees. There are some lower areas which have been improved to ensure adequate drainage to the property, this runs into One Mile Creek that is located on the neighboring property. Notably the property has Spiny Rush (*Juncus Acutus*) and Cape Weed (*Arctotheca*) present, on occasion rabbits have been sighted.

- 3) Description of how the land management issues will be addressed;

I plan to improve the property by following a strict management plan that will include improvement of pasture, removing the pest weeds and clearing the debris from the Eucalypts trees. The property will be fenced to ensure no overgrazing and to protect low-lying areas through the wetter months.

Fencing will be "Stallion Rail" which is essentially electrified post and rail.

The effluent disposal area will located at least 60 meters from the existing waterways which is in accordance with the EPA guidelines.

No native vegetation is proposed to be removed with additional plantings of approximately 50 semi mature *Pyrus Calleryana* (Ornamental Pear 'Capital') to act as a windbreak around the perimeter of the property.

The property is current one large paddock with no internal fencing, the proposed image shows the below details which are planned,

- Horse Paddocks
- Horse Arena
- Stables
- Horse Shelters
- Entrance Road
- Lane Ways
- Proposed dwelling site

| Activities/Actions | Proposed timeline | Proposed completion |
|---|---------------------------|----------------------------|
| Install access gate/Driveway off Baddaginnie-Benalla Road | 1 st July 2024 | 7 th July 2024 |
| Earthworks/Cut pads for Horse Arena/Stables/House site | 1 st July 2024 | 14 th July 2024 |
| Revegetate with <i>Pyrus Calleryana</i> | Winter 2024 | Spring 2024 |
| Install fencing for horse paddocks | Winter 2024 | Spring 2024 |
| Construct Horse Arena & Stables | Spring 2024 | Summer 2024 |
| Construct Horse Shelters | Spring 2024 | Summer 2025 |
| Install internal roads | Summer 2025 | Winter 2025 |
| Construct Dwelling | Summer 2025 | Winter 2025 |

1. INTRODUCTION

This application proposes the use and development of land for the construction of a dwelling in association with for thoroughbred retaining facility for retired racehorses.

It is well known that retired racehorses' welfare poses a huge challenge to the racing industry, amid calls for a change across the board.

Last breeding season, around 14,000 thoroughbred foals hit the ground in Australia. Thousands are being retired each year and not all of them are adequately re-purposed. Whilst many successful female racehorses go on to have a breeding career, geldings and the slower runners are often exposed to racing's wastage threat.

An ABC program exposed the widespread slaughter of racehorses for pet food and human consumption in NSW and Queensland, which has led to increased scrutiny including public awareness of how the industry operates nationwide.

In Victoria, veterinarians will be sent to Victorian farms to euthanise retired racehorses to save them from being killed in abattoirs and knackeries, as part of the Victorian racing industry's response to ABC investigation that exposed cruel treatment of thoroughbreds.

The owner is passionate about providing support to ex-racehorses and is proposing to provide a facility where there is an opportunity for training and rehoming. The owner also competes nationally in show events, where she has retrained ex-racehorses.

The mission of the owner is to spread awareness about the range of possibilities the ex-horses can bring into the right person's life. These ex-racehorses are and can be used as top show or performance horses, companions, therapy horses or trail mounts. Many thoroughbreds are making the transition successfully and having a positive impact on people's lives.

The address is known as Crown Allotment 33 Section U, 125 Baddaginnie-Benalla Road, Benalla and totals approximately 4.12 hectares in area. The lot is not encumbered on title with any covenants or agreements.

The planning application is accompanied by various documents, including:

- Application form
- Elevations of proposed dwelling and shed
- Site Plan
- Planning Report
- Titles and Title Plan
- Land Capability Assessment

2. SUBJECT SITE & SURROUNDS

The subject site is located on the corner of Baddaginnie-Benalla Road and Golden Vale Road. It is irregular in shape and totals approximately 4.12 hectares in area.

The site is generally flat and contains remnant vegetation contained mainly along the western and southern boundary and also scattered throughout the site.

The immediate area is a mixture of some farming lots including some smaller allotments used as lifestyle properties and usually developed. The site is located less than 1 km from the outskirts of Benalla. The surrounding land is used for grazing and also horse enterprises

Figure 1: Subject Site

Figure 2: Aerial of Subject Site and Surrounding Area

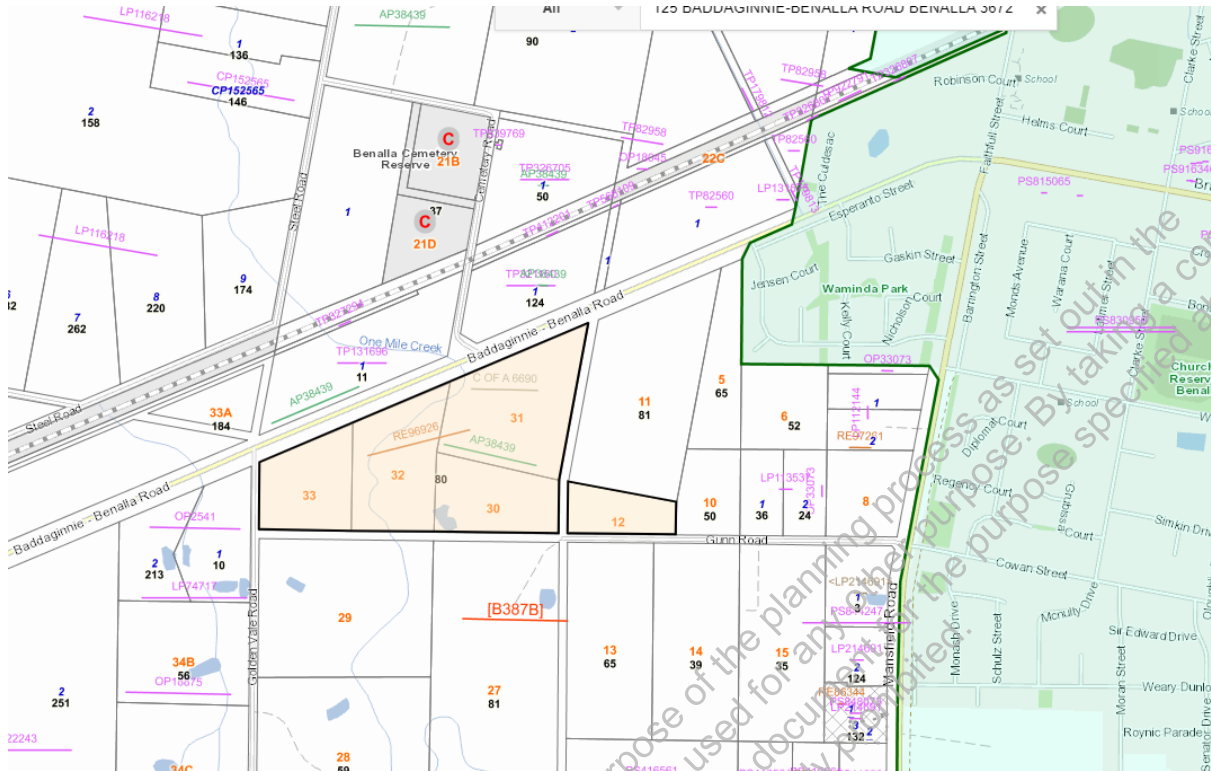

Figure 3: Lot Layout (LASSI April 2024)

3. PROPOSAL

The application seeks permission for the use and development of a dwelling to oversee the retraining centre. The new proposed owner who wishes to purchase the land competes nationally in dressage and show jumping. It is intended the facility will also cater for ex-racehorses which is part of the rehoming program whilst seeking a permanent home.

The application proposes the development of a dwelling, horse arena and farm shed/stables.

The dwelling is a single storey with the following floor plan:

- Master bedroom with ensuite & wir, 3 x bedrooms with bir, study, play room, store, kitchen, pantry, living, laundry dining, family, outdoor room, bathroom, powder room, alfresco, and double garage.

The dwelling will be constructed from face brickwork, weatherboard cladding and corrugated colorbond metal roof in 'wallaby', 'surfmist' and 'monument' colours.

The colorbond shed will be 12m wide and 20m long with a total height of 5.353m. A total of 10 windows will be provided on each bay on the east and west elevation, with a single entry door and 4m wide roller door provided on the north elevation.

The dwelling will be setback 93m from the southern boundary and 12m from the eastern boundary. Details are provided on the Site Plan, in regard, to setback distances of the proposed shedding, and effluent field location.

Figure 4: Elevations of the Proposed Dwelling

4. PLANNING PERMIT TRIGGERS

Clause 35.07-4 Farming Zone – Use and development of a dwelling

5. ZONES

5.1 FARMING ZONE

The purpose of the Farming Zone is:

- To implement the Municipal Planning Strategy and the Planning Policy Framework
- To provide for the use of land for agriculture.
- To encourage the retention of productive agricultural land.
- To ensure that non-agricultural uses, including dwellings, do not adversely affect the use of land for agriculture.
- To encourage the retention of employment and population to support rural communities.
- To encourage use and development of land based on comprehensive and sustainable land management practices and infrastructure provision.
- To provide for the use and development of land for the specific purposes identified in a schedule to this zone.

FARMING ZONE (FZ)

SCHEDULE TO THE FARMING ZONE (FZ)

Figure 8: Zoning Map

6. OVERLAYS

The subject site is not affected by any overlays.

|-------------------|---|--------|
| Question 1 | Is the proposed activity , or all the proposed activities, exempt? | Yes |
| Answer: | <p><u>ON THE BASIS OF THE ANSWERS YOU HAVE ENTERED</u></p> <p><u>YOU ARE NOT REQUIRED BY THE REGULATIONS TO PREPARE A CULTURAL HERITAGE MANAGEMENT PLAN FOR THIS PROJECT</u></p> | |
| | <p>This process list is for information purposes only; the result must not be relied upon by a statutory authority in deciding whether a cultural heritage management plan is required for a proposed activity.</p> | |

7.2 BUSHFIRE PRONE AREA

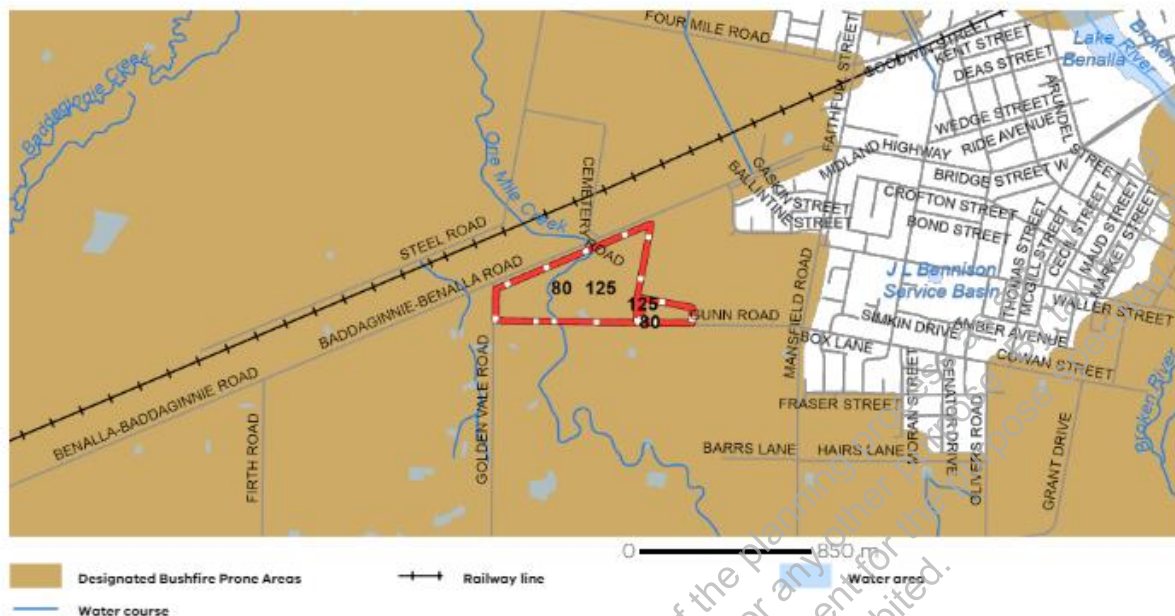

Figure 10: Bushfire Prone Area – Map

8. PLANNING POLICY FRAMEWORK

CLAUSE 02.01 CONTEXT

This clause identifies Benalla Rural City covers an area of 2354 square kilometres, has a population of 14,020 (VIF 2019) and is situated in Victoria's north east approximately 180 kilometres from Melbourne. The urban centre of Benalla is the major city and supports a network of smaller towns including Baddaginnie, Goorambat, Devenish, Swanpool, Tatong, Thoona and Winton.

Benalla Rural City is a diverse rural municipality based on the Broken River. It also includes fertile agricultural land along the Hollands Creek which is a major tributary to the Broken River.

The municipality is strategically located on the nationally significant Hume and Midland Highways and Melbourne to Sydney Railway. This convergence of transport routes means Benalla is a significant transport hub which is a major benefit to local industry.

The economy is focussed on Benalla's regional centre role, agricultural production, tourism and manufacturing. It is dominated by employment in the manufacturing, retail trade, agriculture and health and community services sectors.

The Benalla Central Business District (CBD) serves a large rural hinterland and provides a wide range of higher order community services and facilities but faces strong competition from Shepparton and Wangaratta.

The municipality has a strong industrial base located to the north and east of Benalla. The industries are generally based on specialist manufacturing, processing of timber products, value adding to agricultural produce and providing a service base for the region.

The rural areas of the municipality are acknowledged for good soils and access to irrigation water. The major agricultural industries are prime lamb, beef production and broad acre cropping, with some irrigation and dairying. More recent agricultural uses include viticulture, horticulture and forestry.

CLAUSE 02.03-4 NATURAL RESOURCE MANAGEMENT

Agriculture

This clause identifies The rural areas of the municipality comprise high quality and versatile agricultural land. Rural production is a very important component of the municipality's economy, and a finite resource. This asset is threatened from inappropriate subdivision and housing development.

Rural activities produce off-site effects that can be incompatible with residential uses. Farming practices in rural areas should not be diminished by encroachment of incompatible development in rural zones. However, a one-off excision of an unwanted rural dwelling may limit the distortion of rural land prices.

The fragmentation of high quality agricultural land is discouraged as farm sizes have progressively increased. Farm consolidation is a fundamental long-term objective.

In protecting agricultural areas, Council seeks to:

- Limit subdivision and new dwellings on high quality and versatile agricultural land.
- Maintain the sustainable use and productive potential of rural land.
- Discourage non-agricultural uses where they will impact agriculture.
- Avoid the fragmentation of productive agricultural land by subdivision, particularly lots for housing.
- Encourage alternative agricultural pursuits.
- Support proposals for non-agricultural uses in rural areas only when they are compatible with surrounding agricultural use and can be justified in terms of broader community benefit.
- Encourage agricultural practices that are not detrimental to the environment.
- Encourage the consolidation of farm lots.
- Locate intensive animal industries in areas that minimise land use conflict.

CLAUSE 14.01-1S PROTECTION OF AGRICULTURAL LAND

This clause is of relevance as the objective is to protect the state's agricultural base by preserving productive farmland.

CLAUSE 14.01-1L RURAL DWELLINGS AND SUBDIVISION POLICY

This clause is of relevance as the application is proposing a dwelling and the lot is under 40 hectares in area.

Strategies

Discourage dwellings on existing small lots except where either:

- Substantial services and infrastructure works have been completed;
- The site has no agricultural potential and native vegetation will be retained;
- It will not inhibit the agricultural practices of existing farms.

Ensure dwellings and subdivisions are designed to respond to the site, landform, vegetation, waterways, drainage lines, services, adjoining land uses, dwellings and ongoing agricultural activities.

Ensure dwellings and subdivision can contain and treat on-site effluent and wastewater in accordance with the State Environment Protection Policy (Waters of Victoria) under the Environment Protection Act 1970.

Locate dwellings on land where the agricultural quality is low and is not subject to flooding.

Ensure the proposed dwelling is necessary for the continued agricultural use of the land.

CLAUSE 14.02-1S CATCHMENT PLANNING AND MANAGEMENT

This clause is of relevance as the site is located near a number of waterways. The objective is to assist with the protection and restoration of catchments, water bodies, groundwater, and the marine environment.

CLAUSE 14.02-2S WATER QUALITY

This clause is of relevance to this application as the objective is to protect water quality.

CLAUSE 17.01-1S DIVERSIFIED ECONOMY

This clause is of relevance as the objective is to strengthen and diversity the economy.

9. PARTICULAR PROVISIONS

The particular provisions are specific pre-requisites or planning provisions for a range of particular uses and development, that apply consistently across the State. It is noted that there are no particular provisions that are applicable to the proposal.

10. GENERAL PROVISIONS

9.1 CLAUSE 65.01 DECISION GUIDELINES – APPROVAL OF AN APPLICATION OR PLAN

The Responsible Authority must decide whether the proposal will produce acceptable outcomes in terms of decision guidelines of this Clause. Clause 65.01 sets out the matters the Responsible Authority must consider when assessing an application to subdivide land.

11. PLANNING ASSESSMENT

Based on the provisions of the Benalla Planning Scheme and the decision guidelines, the following, are considered to be key planning considerations relevant to the proposed replacement dwelling and change of use to dependent persons unit:

- Planning Policy Framework
- Farming Zone Decision Guidelines

10.1 PLANNING POLICY FRAMEWORK

Planning Policies seek to support and enhance agricultural pursuits by ensuring future development, particularly residential development, does not result in the permanent removal of productive agricultural land or inhibit the continuation and development of existing agricultural uses. These objectives are reiterated in the purpose of the Farming Zone.

Planning Policy has emphasised the need to protect agricultural land, particularly from encroachment of non-agricultural development. In this case the development of a dwelling on the site, would serve to enhance the use of the subject site for agriculture.

The key matter requiring consideration in this case is the demonstrated requirement for a dwelling on the site. The impact of the dwelling on the land and the ability to sustain viable agricultural use. Planning Policy Framework seeks to support and enhance agricultural use by ensuring that future development, particularly residential development, does not result in the permanent removal of agricultural land or inhibit the continuation of existing or future agricultural uses.

The proposal demonstrates a nexus between agricultural land use and the necessity of a dwelling on the land. The proposal is consistent with the relevant policies and vision within the PPF relating to protection and sustainable use of agricultural land. The proposal is also deemed consistent to specific objectives and strategies sought in the Municipal Strategic Statement. The proposal will not result in 'fragmentation' of agricultural land as the land will continue to be used for agriculture.

The development of the subject site for a dwelling is said to be consistent with the planning policy in relation to rural and regional development, as the end result will be one which will allow the agricultural use on the land to occur and the dwelling is required to support the agricultural use.

The dwelling on the subject land will assist the owners to run an agricultural use without impacting the surrounding land uses. The surrounding area is fragmented in terms of agricultural land as the lot sizes in the area are smaller in size to sustain a large scale agriculture. The most effective option to gain agricultural yield from these lots is to allow small scale agricultural uses (like the one proposed in this case) to enhance the protection of agricultural land.

The policies under Clause 14 seek to protect agricultural land and avoid fragmentation of agricultural land. As mentioned above the land is already fragmented as the area displays a character of small parcels within the Farming Zone. The proposal in this regard seeks to protect the agricultural land by introducing an agricultural use that can occur on the land without the need of a bigger land parcel and the dwelling is required to support the agricultural use. The nature of the agricultural use being proposed requires the owners to live on the property and without residing on the land it would be unable to continue such a unique agricultural operation.

The construction of a dwelling on this lot will not contribute to a fragmentation of rural land. The area is already fragmented containing rural land holdings and effectively removed lots on which dwellings have been permitted from agricultural production. This proposal does not contribute to the further fragmentation of rural land.

Clause 14.01-1L primary purpose is to ensure that the development of dwellings and excision of existing dwellings are consistent with the use of land for sustainable rural uses. In relation to dwellings in the FZ, the policy seeks to support a dwelling where the dwelling will not result in the property being removed from agricultural production and the primary use of the land will continue to be agriculture. Existing agricultural activity on adjoining land will not be compromised and the proportion of the property used for the dwelling and ancillary infrastructure is minimised and located on the area of lowest agricultural quality.

The application states that the site has a capacity for the proposed agricultural use. The management of the operation would require various animal husbandry practices to monitor and manage horses such as managing feed and water during times of drought, rotation of paddocks within the site and improvements to the pasture and other land management practices to manage weeds and pests. All these operations obviously cannot occur without living on the site as it requires ongoing presence.

The dwelling on the subject land will protect the agricultural land as it is required for agriculture. The site is currently not used for agriculture and has not been used for agriculture for quite some time. The owner's intention is to live on the land and do an agricultural operation that the land can sustain in long term.

Only a small fraction of the land will be taken out of agriculture for the dwelling and the dwelling is needed so the landowner can properly attend to the farming pursuits, thus it is considered that this farmland will continue to be protected and enhanced as a result of productive farming pursuits as detailed in the farm management plan.

The primary purpose of the land for farming will remain as the farm dwelling is needed to ensure that the agricultural operations can be sustained and further developed as part of an established business enterprise. The dwelling will remain a secondary element in relation to how the land is going to be used. It is not a rural residential land use but a farm dwelling which contributes to productive farming and ensure the lands agricultural values and outputs are enhanced. The proposed farm dwelling is compatible with its rural setting given its purpose to assist with legitimate farming pursuits that cannot be properly undertaken or developed without occupation of the land.

The need and rationale for the dwelling ensures agriculture is the predominant use of the land in accordance with the Farm Plan. It is submitted that the proposed farm dwelling facilitates and supports the continued and enhanced operation of the land for a productive farming enterprise. The dwelling is related to enhance agricultural production.

10.2 FARMING ZONE DECISION GUIDELINES

| Farming Zone – Clause 35.07-6 Decision Guidelines | Assessment |
|---|--|
| General Issues | |
| The Municipal Planning Strategy and the Planning Policy Framework. | The proposal is consistent with policy that is compatible with economic, social and environmental objectives of the state. |
| Any Regional Catchment Strategy and associated plan applying to the land. | There is no regional catchment strategy applying to the land. |
| The capability of the land to accommodate the proposed use or development, including the disposal of effluent. | The land has the capability to accommodate the proposed use. The area of the land is large and effluent disposal in association with the dwelling can be managed on site. |
| How the use or development relates to sustainable land management. | A farm management plan has been prepared to ensure the sustainable management of the land. |
| Whether the site is suitable for the use or development and whether the proposal is compatible with adjoining and nearby land uses. | The site is suitable for the proposed use. The main aim for the proposal is to support the agriculture use which is consistent with the zone. The surrounding area comprises varied lot sizes being used for various agricultural uses and rural lifestyle. The proposal will be compatible with the surrounding area in a sense that the agricultural use will continue to occur on site. |
| How the use and development makes use of existing infrastructure and services. | The existing infrastructure on the property will be used in association with the agricultural use for retaining of ex-racehorses. |

| | |
|--|--|
| The impact of buildings and works on significant views. | The proposed dwelling has generous setbacks from each boundary and will not impact any significant views. |
| Agricultural issues and the impacts from non-agricultural uses | |
| Whether the use or development will support and enhance agricultural production. | The proposal will enhance the agricultural use via the implementation of the farming enterprise which involves horse retraining including assisting with the rehoming of ex-racehorses not suitable for show eventing or competition. |
| Whether the use or development will adversely affect soil quality or permanently remove land from agricultural production. | The dwelling occupies a small portion of the land, with the majority of the land being used for the agricultural operation. |
| The potential for the use or development to limit the operation and expansion of adjoining and nearby agricultural uses. | The proposal will not limit agricultural activities in the area as the proposal itself involves an agricultural use. |
| The capacity of the site to sustain the agricultural use. | The site is under 40 hectares in area and has the capacity to sustain the agricultural use. |
| The agricultural qualities of the land, such as soil quality, access to water and access to rural infrastructure. | The site will be improved to be and to be provided with water and access to rural infrastructure. |
| Any integrated land management plan prepared for the site. | A Farm Management Plan has been prepared for the site which provides details how the land will be managed |
| Accommodation issues | |
| Whether the dwelling will result in the loss or fragmentation of productive agricultural land. | The dwelling will occupy a small portion of the land with the majority of the land used for agricultural operation. It can be argued that the land to be used for dwelling will be permanently removed from agriculture however as mentioned above it will be a small portion when compared to the overall size of the land. |
| Whether the dwelling will be adversely affected by agricultural activities on adjacent and nearby land due to dust, noise, odour, use of chemicals and farm machinery, traffic and hours of operation. | The dwelling will not be affected by agricultural activities as it will be setback reasonably from the boundaries. |
| Whether the dwelling will adversely affect the operation and expansion of adjoining and nearby agricultural uses. | This has been discussed above under the policy. |
| The potential for the proposal to lead to a concentration or proliferation of dwellings in | There is no potential for the dwelling to lead to a concentration or proliferation of dwellings. |

| | |
|--|---|
| the area and the impact of this on the use of the land for agriculture. | |
| The potential for accommodation to be adversely affected by noise and shadow flicker impacts if it is located within one kilometre from the nearest title boundary of land subject to: – A permit for a wind energy facility; or – An application for a permit for a wind energy facility; or – An incorporated document approving a wind energy facility; or – A proposed wind energy facility for which an action has been taken under section 8(1), 8(2), 8(3) or 8(4) of the <i>Environment Effects Act 1978</i> . | Not applicable. |
| The potential for accommodation to be adversely affected by vehicular traffic, noise, blasting, dust and vibration from an existing or proposed extractive industry operation if it is located within 500 metres from the nearest title boundary of land on which a work authority has been applied for or granted under the <i>Mineral Resources (Sustainable Development) Act 1990</i> . | Not applicable |
| Environmental issues | |
| The impact of the proposal on the natural physical features and resources of the area, in particular on soil and water quality | The proposal will not impact the soil and water quality as discussed above. |
| The impact of the use or development on the flora and fauna on the site and its surrounds. | No native vegetation is required to be removed. |
| The need to protect and enhance the biodiversity of the area, including the retention of vegetation and faunal habitat and the need to revegetate land including riparian buffers along waterways, gullies, ridgelines, property boundaries and saline discharge and recharge area. | No native vegetation is required to be removed. |
| The location of on-site effluent disposal areas to minimise the impact of nutrient loads on waterways and native vegetation. | The site plan provides details of the effluent disposal field. |
| Design and siting issues | |

| | |
|--|---|
| <p>The need to locate buildings in one area to avoid any adverse impacts on surrounding agricultural uses and to minimise the loss of productive agricultural land.</p> | <p>Complies. The scale of the development is small when compared with the size of the land. The location of the dwelling has been selected to manage the site in terms of agricultural use.</p> |
| <p>The impact of the siting, design, height, bulk, colours and materials to be used, on the natural environment, major roads, vistas and water features and the measures to be undertaken to minimise any adverse impacts.</p> | <p>The dwelling is to be constructed of muted tones, and located with generous setbacks where there are no adverse impacts anticipated.</p> |
| <p>The impact on the character and appearance of the area or features of architectural, historic or scientific significance or of natural scenic beauty or importance.</p> | <p>Not applicable to the site.</p> |
| <p>The location and design of existing and proposed infrastructure including roads, gas, water, drainage, telecommunications and sewerage facilities.</p> | <p>Access to the site will be in accordance with Council's condition with the appropriate utilities such as water, septic system and drainage being undertaken as part of the approved development.</p> |
| <p>Whether the use and development will require traffic management measures.</p> | <p>The use and development of the land for a dwelling will not require any significant traffic management measures.</p> |
| <p>The need to locate and design buildings used for accommodation to avoid or reduce noise and shadow flicker impacts from the operation of a wind energy facility if it is located within one kilometre from the nearest title boundary of land subject to:</p> <ul style="list-style-type: none"> - A permit for a wind energy facility; or - An application for a permit for a wind energy facility; or - An incorporated document approving a wind energy facility; or - A proposed wind energy facility for which an action has been taken under section 8(1), 8(2), 8(3) or 8(4) of the <i>Environment Effects Act 1978</i>. | <p>Not applicable.</p> |
| <p>The need to locate and design buildings used for accommodation to avoid or reduce the impact from vehicular traffic, noise, blasting, dust and vibration from an existing or proposed extractive industry operation if it is located within 500 metres from the nearest title boundary of land on which a work authority has been applied for or granted</p> | <p>Not applicable.</p> |

| | |

11 RELEVANT VCAT CASE & FURTHER CONSIDERATION

In *Dinning v Macedon Ranges SC* [2018] VCAT 490, Member David while approving a dwelling in association with an ex-racehorse refuge/retraining centre (similar to the proposal) made following comments:

"36...I accept that the proposed use for the retraining of horses represents intensification of agricultural use relative to the low intensity grazing use to which the land has been put in the past. I find that the small area of land to be lost to agriculture for a proposed dwelling is counterbalanced by the increased intensification of agricultural use on the site.

37. I therefore do not accept the Councils contention that the proposal is contrary to the purpose of the FZ regarding the use of land for agriculture, retention of productive agricultural land, and ensuring that non-agricultural uses (including dwellings) do not adversely affect the use of land for agriculture."

The above decision has the relevance to the proposal as the current proposal is seeking to introduce a new agricultural use in contrast to conventional agricultural uses. The land can sustain the agricultural as confirmed via the provision of management plans.

The proposal will contribute to agricultural production on a small scale and is considered to be complementary to the current farming activities being undertaken in the surrounding area. There will be limited impact to the soil quality and the addition of dwelling will not impact agricultural production.

Clause 71.02-3 (Integrated Decision Making) states that:

Society has various needs and expectations such as land for settlement, protection of the environment, economic wellbeing, various social needs, proper management of resources and infrastructure. Planning aims to meet these needs and expectations by addressing aspects of economic, environmental and social wellbeing affected by land use and development.

Planning and responsible authorities should endeavour to integrate the range of planning policies relevant to the issues to be determined and balance conflicting objectives in favour of net community benefit and sustainable development for the benefit of present and future generations. However, in bushfire affected areas, planning and responsible authorities must prioritise the protection of human life over all other policy considerations.

Planning authorities should identify the potential for regional impacts in their decision making and coordinate strategic planning with their neighbours and other public bodies to achieve sustainable development and effective and efficient use of resources.

The proposal will be able to balance conflicting objectives and will result in sustainable development of the land. The objectives in relation to the protection of agricultural land will

be achieved by resulting in a dwelling which is required for agriculture. The proposal will result in net community benefit.

The proposal will also be consistent with the objectives of planning in Victoria specified under Section 4 of the Planning and Environment Act 1987 as it will result in fair, orderly, economic and sustainable use, and development of land by proposing a development in farming zone which will be able to protect agricultural land.

12 CONCLUSION

The proposal seeks approval for building and works associated with a dwelling, where the report has assessed against the relevant policy and controls of the Benalla Planning Scheme as follows:

- The proposal has policy support at Planning Policy Framework.
- The proposed development of a dwelling meets the purpose of the farming zone including policy.
- It is considered that it complies with the overall planning considerations and environmental standards.
- The proposed development has been sited and the use is compatible with surrounding landscapes and is buffered by generous setbacks from any adjoining properties.
- The proposal will not impact the water quality as it is proposed to be developed which satisfies the EPA Code of Practice.

The assessment undertaken in this report has demonstrated the application is consistent with the Planning Policy Framework and the requirements of the Farming Zone, including Clause 65 of the Benalla Planning Scheme. It is therefore requested that approval of a planning permit be granted.
